

Atomic Force Microscopy – Infrared (AFM-IR) spectroscopy for sub-particle imaging of human milk extracellular vesicles and the role of their lipidic make-up in necrotizing enterocolitis

It's always a pleasure for me to return to TU Wien for many good reasons. While the excellent working conditions and well-equipped labs are significant, the true professional value lies in the exchange with my colleagues and friends. Beyond the scientific work, being in a different environment is incredibly inspiring, and there's always some time to explore the country's rich culture and natural beauty. I hope this encourages other scientists to venture abroad and experience new places - it requires extra effort, but the rewards are well worth it!
